What Claude desktop and Devin ship, and where Modbit stands

Claude desktop 4.23118.1, Devin 3.12.43 and Cursor 3.25.6 are installed here. Their columns come from public documentation and release notes read on 2026-11-11 (Claude Code desktop docs, Devin release notes to 2026-11-09, Cursor 3.23 teardown), not from the app bundles. The Modbit columns come from a keyword search of the renderer and the protocol definitions. A similar name is not proof of behaviour.

The Core is ahead

Almost every row below is already in the protocol: checkpoints, worktrees, automations, skills, knowledge, forge comments, computer use, queue and steer, evidence, budgets.

The UI is behind

Where the Core says Yes and the UI says Part or a dash, the work is design and rendering: pane layout, activity stream, project rules, auto-fix, merge when ready, hover preview, split view.

A few gaps are in the Core too

Side chat and next-prompt suggestion have no protocol support. They are not drawn yet and need a Core change before they can ship.

Yes has it · Part partly, or behind a flag · — not found in what I read, not proof it is absent · ? unclear from the sources · Gap missing in the Core, needs new protocol · Needs Core not drawn until the Core supports it
